In a differential pressure drop device the flow is calculated by measuring the pressure drop over an obstructions inserted in the flow. The differential pressure flow meter is based on the Bernoulli Equation where the pressure drop and the further measured signal is a function of the square flow speed.  $dp = \rho v^2 / 2$  (1)

The most common volume units are:  $m^3/s$ ,  $m^3/h$ ,  $l/h$ ,  $l/min$ , GPM (gallons per minute),  $Nm^3/h$  (normal cubic meter per hour), SCFH (normal cubic foot per hour), among others., where:  $V$  = volume,  $t$  = time,  $Q$  = volume flow. Mass flow- It is defined as the mass quantity of a fluid that flows through a given section at a considered time interval. The most used mass flow units are:  $kg/s$ ,  $kg/h$ ,  $t/h$ ,  $lb/h$ .

Accurate measurement of flow rate of liquids and gases is an essential requirement for maintaining the quality of industrial processes. In fact, most of the industrial control loops control the flow rates of incoming liquids or gases in order to achieve the control objective. As a result, accurate measurement of flow rate is very important.
